

[Explore iPhone X And iPhone 8 Plus Portrait Lighting Mode Features](#)

Apple recently designed Portrait features on iPhone 8 Plus and iPhone X by adjusting its dual cameras.

Online PR News “30-October-2017” This all newly introduced effect enhances the DSLR cameras quality while making every clicked images look more professional. The Portrait Mode was already with the iPhone but, it now comes with more enhanced and twisting camera features. It allows users to analyze every scene around them by fully manipulating the lighting without any additional tools. Now make your photo look like a studio shot under dramatic lighting conditions, as if you are in real world. iPhone's Portrait Lighting is currently in beta version but your clicked snapshots will look even great with all fun like never before.

Â

But how you will use this feature? Our professional team at iPhone Support Number have provided instructions below on how to work with this new feature:

Â

Getting Started

Â

People working with the iPhone 8 Plus or iPhone X, can work with the 3D Touch Camera app by selecting the "Take Portrait" icon. Or alternatively they can simply open the Camera app and then switch to the Portrait mode by swiping left or even right. Once they have turned on the Portrait Mode, they can now point their camera at appropriate area where the iPhone will start showing you directions such as "to move closer to", "far away from the subject", etc. One of the most effective ways to get optimal results for your clicked pictures.

Â

Lighting Modes

Â

Once the selection has been done for the Portrait feature in your camera mode, you will come across five Portrait Lighting features to choose from. All these can easily be selected from the menu located at the bottom of the viewfinder. Below are top functionality for this feature:

Â

Natural Light: This is a setting which is the typical Portrait mode which is easily found in the iPhone 7 Plus. It won't change the lighting feature than a camera normally would.

Â

Studio Light: A kind of settings which will brighten up the subject of the images as if it is right under a bright studio light.

Â

Contour Light: Similar to studio lights which enhances the light around the edges of the subject while creating more dramatic appearance.

Â

Stage Light: It takes the dramatic look one step ahead which focuses on the face while eliminating the background of an image. A bright and dramatic face against a black background is displayed.

Â

Working with the New Portrait Lighting Mode

Â

While you work with any of these modes from the slider located at the bottom of the camera display, users will easily be able to select their choice modes after shooting their picture. Even if you are taking a photo with the help of one light setting, applying any of the other four settings can easily be done.
